

The LanguageSwitch action 1.0

Introduction:

The LanguageSwitch action is used in a "default page" to redirect browsers in certain languages to another page.

If you supply the same page in, let's say, both Swedish and English, you might want to have the English version as the entry/default page and then redirect all people with browsers in Swedish to a page in Swedish.

You should be very careful and make sure you use the right page as the "default page", if the visitor's browser doesn't report the language info, they will stay in that default page, no redirection will take place.

Manual:

1. Use the LanguageSwitch action as a head action,
2. Set the action to run onParse.
3. Enter a comma separated list of languages, DON'T USE SPACES!! Your list should look something like this: DE,SE,EN
4. Type a URL for the redirection, or use brows, or point and shoot.
5. Test the page before uploading.

Please note that some language codes, like the English, comes in more than one version, like US-EN and UK-EN. If you enter "EN" in the action language list the action will search for the "EN" part in the code. If you, on the other hand, enter "UK" in the list, the action will redirect users with a UK English browser version. **I don't recommend that you use the sub language, it's not as well supported as the main language!**

There is, of course, no guarantee that a person using a browser in German actually speaks German, but I would say that the odds are good... For more information on language codes please see the enclosed list.
